

NEXUSFLOW TECHNOLOGIES: INTERNAL POLICY & TOOLS

Section 1: Access and Security All new engineers are required to set up their environment on the first day.

- **VPN Access:** We use TunnelBear for internal network security. Contact Jenny in Ops to get your unique credentials.
- **Git Flow:** All code must be pushed to our internal GitLab instance at `git.nexusflow.internal`.
- **Code Reviews:** No code goes to production without at least two approvals. Mike is the lead reviewer for the Alpha and Beta repositories.

Section 2: Communication Stack

- **Slack:** Primary communication. Join `#dev-general`, `#onboarding`, and `#emergency-ops`.
- **Standups:** Every morning at 9:00 AM via Google Meet. Link is in the shared "Engineering Calendar."
- **Documentation:** All SOPs are stored in the `/data/docs` folder of the main server.

Section 3: Incident Management If the server crashes (Status 500):

1. Check the AWS Console.
2. Alert the `#emergency-ops` channel.
3. Mike or Jenny will provide the SSH key for emergency access.
4. Always log the incident in the "Post-Mortem" database.

Section 4: Office Life The kitchen is stocked every Monday. If you use the last of the coffee, notify the `#office-admin` channel.

Why this is a great test for your AI:

1. **Tool Identification:** The Onboarding Guide should pick up **TunnelBear**, **GitLab**, and **Slack** as "Tools You'll Need."
2. **Key Personnel:** It should identify **Jenny** and **Mike** as the people to go to for help.
3. **Complex Logic:** It requires the AI to ignore the "Coffee" part (Office Life) and focus on the technical onboarding if the prompt is about "Engineering Setup."

Testing the Workflow:

1. Save the text above as engineering_handbook.pdf.
2. Drop it into F:\AI Projects\nexus-flow\data\uploads.
3. Go to your **Streamlit UI** and click "**Sync /uploads folder**".
4. In the "Onboarding Guide" tab, type "**Engineering Team Onboarding**" and hit build.
